Food Safety and Produce Traceability

The Ministry of Agriculture, Food and Rural Affairs defines "traceability" as "the ability to trace and follow food, feed, food-producing animals and substances through all stages of production and distribution".

Traceability systems support multiple purposes for both public and private good. Outbreaks of illnesses due to food-borne diseases, in Canada and around the world, continue to show the need for efficient systems to trace a food product to its origin (including all raw and packaging materials used if any), as well as to track the product to its current location to conduct an effective recall and reduce the scope of the outbreak.

PICS software supports these initiatives and we at WaudWare support you!
